Spring Dormant Haskap Planting Instructions

Once your plants have arrived, plant them as soon as possible.

Planting:

1. Dig a hole 2-3 times as wide as the root mass width.
2. Place the root collar (where the stem meets the root) 1" below the soil surface, max.
3. Make sure the sides of the hole are soft, rough, and uneven as this will help speed root development in native soil. Watch for clay soil based smearing when creating the hole.
4. Place the baby shrub in the hole, making sure it is visually straight.
5. Backfill with soil around the roots until the hole is half full.
6. Water to settle the soil and remove air pockets.
7. Continue adding soil until hole is filled.
8. Build a soil berm to form a basin or depression around the edge of filled hole.
9. Fill depression with water several times always allowing it to soak into the root area between each filling.
10. Fill the depression with mulch.

Planting Tips:

- Plant in full sun in loose, well-drained soil rich in organic matter.
- Plant 3-4' apart for commercial production, 5' apart for U-pick or home gardening.
- They prefer Sandy Loam soil.
- Keep watered and weed free throughout the summer and fall.
- Thin centre at maturity.

We wish you all the best this growing season. If you have any questions or concerns please feel free to contact us. Thanks again for your order, we truly appreciate it.

Happy Planting,

Curtis + Leslie
